# BRIEF INFORMATION
## Oil pressure and temperature sensor (OPS+T)

> Continuous measurement of the oil pressure
> Continuous measurement of the oil temperature
> Rugged and reliable design

## PRODUCT FEATURES

### Application

The oil pressure and temperature sensor OPS+T is used to measure the absolute oil pressure and the oil temperature directly in the main oil channel behind the oil filter.

It uses the pressure value for demand-responsive control of mechanical or electrical oil pumps. This minimizes $CO_2$ emissions and reduces fuel consumption. Recording the temperature is used as input data for thermal management of the engine. The two signals are evaluated in the higher-level control unit.

Usable in harsh environments thanks to the integration of the multi-chip module.

### Design and function

The OPS+T is based on a multi-chip module (MCM), consisting a piezo-resistive cell for measuring the absolute pressure as well as an ASIC for the digital evaluation and further processing of the information. The oil temperature can also be established using a diode which is integrated in the MCM. The PWM output signal is used to transmit both the oil pressure as well as the oil temperature. The engine control unit (ECU) evaluates the PWM output signal from the sensor. The patented technology guarantees leak tightness in view of oils.
# EXTERNAL CIRCUITRY IN THE CONTROL UNIT

A 10 kΩ pull-up resistor should be integrated in the ECU of the vehicle in order to define an idle mode. For optimum reading of the PWM signal, a capacitance of max. 2.2 nF should be integrated so as to compensate for the oscillations.

**For ECU with 3.3 V**

**For ECU with 5 V**

# TECHNICAL DETAILS

| Technical data | |
| --- | --- |
| Operating voltage range | Single-voltage (4.75 – 5.25 V) |
| Rated voltage | 5 V |
| Supply voltage | 4.75 to 5.25 V |
| Pressure measuring range | 0.5 to 10.5 bar |
| Temperature measuring range | - 40 °C to +160 °C |
| Temperature range | - 40 °C to +150 °C |
| Max. temperature | 160 °C (max. 100 h) |
| Output signal | PWM |
| Response time | 2 ms |
| Sampling frequency | < 3 kHz |
| Max. operating pressure | 40 bar |
| Protection class | IP 69K |
| Overpressure | 60 bar |
| Mating connector[1] | Hirschmann 872-858-541 or TE Connectivity 1-1670917-1 |
| Approved | ECE-R10 |

[1] This accessory is not included in the scope of delivery.
   Available from Hirschmann Automotive or TE Connectivity.

Pin 1: Supply
Pin 2: Ground
Pin 3: Output

| Tolerance band for pressure measurement | | | |
| --- | --- | --- | --- |
| Temperature | 0.50 – 3.00 bar | 3.00 – 5.50 bar | 5.50 – 10.50 bar |
| 70 – 160°C | ± 0,15 bar | ± 0,20 bar | ± 0,30 bar |
| 20 – 70°C | ± 0,15 bar | ± 0,20 bar | ± 0,30 bar |
| 0 – 20°C | ± 0,20 bar | ± 0,25 bar | ± 0,35 bar |
| -40 – 0°C | ± 0,40 bar | ± 0,40 bar | ± 0,50 bar |

| Tolerance band for temperature measurement | |
| --- | --- |
| Temperature | Accuracy |
| 135 – 160°C | ± 1 K |
| 20 – 135°C | ± 2 K |
| -40 – 20°C | ± 3 K |

# OUTPUT SIGNAL

A pulse width modulated signal (PWM) is used to provide temperature, pressure and diagnostic information. All the information is sent every 9,216 µs. The higherlevel control unit must be able to measure the different pulse widths of the three square wave signals, which can vary from 128 µs to 3,958 µs. The control unit must provide a suitable sampling frequency and logic for measuring and recording the signals.

$S_1$: Signal, $T_1$: Temperature, $T_2$: Pressure
**General information on the evaluation of PWM communication:** Because of the adjustment accuracy of the oscillator and its temperature dependence, the length of a PWM frame is subject to a maximum tolerance of ± 10 %. Serious hardware errors in the program sequence of the ASIC cancel the PWM communication and are then detectable by the control unit on account of a permanent high level.

## $S_1$: Diagnosis signal

$DC = 0{,}25$   ($S1 = 256\ µs ± 25\ µs$) => OPS functional state
$DC = 0{,}375$ ($S1 = 384\ µs ± 25\ µs$) => Pressure failure
$DC = 0{,}5$     ($S1 = 512\ µs ± 25\ µs$) => Temperature failure
$DC = 0{,}625$ ($S1 = 640\ µs ± 25\ µs$) => Hardware failure

## $T_1$: Temperature evaluation

96.9% of the PWM blocking period T1 (3968 µs) corresponds to the highest point of the measuring range of 160 °C.
3.1% of the PWM blocking period T1 (128 µs) corresponds to the lowest point of the measuring range of -40 °C.

$$T_1\big|_{µs} = 19{,}2\ \tfrac{µs}{°C} \cdot Temp + 896\ µs$$
## $T_2$: Pressure evaluation ($T_2$ Level)

96.9% of the PWM blocking period T2 (3968 µs) corresponds to the highest point of the measuring range of 10.5 bar.
3.1% of the PWM blocking period T2 (128 µs) corresponds to the lowest point of the measuring range of 0.5 bar.

$$T_2\big|_{µs} = 384\ \tfrac{µs}{bar} \cdot Pressure - 64\ µs$$

## ECU calculation

$$Temperature = \left( \frac{4096\ µs}{T_{P1,\,ist}\big|_{µs}} \cdot T_1\big|_{µs} - 128\ µs \right) \cdot \frac{1}{19{,}2}\ \frac{°C}{µs}\ - 40°C$$

$$Pressure = \left( \frac{4096\ µs}{T_{P1,\,ist}\big|_{µs}} \cdot T_2\big|_{µs} - 128\ µs \right) \cdot \frac{1}{384}\ \frac{bar}{µs}\ + 0{,}5\ bar$$

$$Diagnostics = \left( \frac{1024\ µs}{T_{PS1,\,ist}\big|_{µs}} \cdot S_1\big|_{µs} \right)$$
