

GuardRAY® Protective Cages

Description

GuardRAY® offers protection for emergency beacons against all but the most severe damage. GuardRAY units are hot dip galvanised for corrosion protection, and fabricated from heavy welded steel wire, with bases pre-drilled to accept the standard mounting holes of all our popular warning beacons and bases. The beacon is mounted inside the universal base, and the wire cage is then clamped to the base. A nylon lanyard secures the cage from falling when the beacon is serviced.
