

ENERGY-EFFICIENT DRIVING A CURRENT TOPIC

Minimising fuel consumption

A moderate and defensive driving style can make a major contribution to minimising fuel consumption.

Use the following driving tips to consciously make the most of potential savings:

- Change gear in good time
- Don't rev your engine too hard
- Choose the best time to change gear (you should change up from around 2,000 rpm)

Adjust tyre pressure

With luggage on board, you'll be driving with much more weight than normal:

- Set the tyre pressure recommended by your vehicle's manufacturer.

Your advantage:

- Better driving performance and lower tyre wear
Lower fuel consumption and thus, for example, a positive effect on the environment from road traffic

Economical driving with less weight

Especially on longer routes, additional weight makes itself felt with unnecessary fuel consumption:

- As far as possible, only load your vehicle immediately before departure.
- When at your destination, only carry what you need in the vehicle.
- Take time to unload all luggage immediately on your return and also dismantle roof boxes and bicycle racks.

... It's worth it!
