BRIEF INFORMATION

Intelligent battery sensor (IBS) 24 V

→ High-accuracy measurement of battery voltage, current and temperature parameters
→ Determination of the battery state of charge (SOC), state of health (SOH) and state of function (SOF) condition parameters
→ Simple electrical and mechanical integration

Benefit to the customer
The Intelligent Battery Sensor (IBS) informs you about the current energy status, allowing you to plan your energy supply.

In order to carefully conserve the energy of the vehicle battery, it is necessary to know the state of charge, ageing and any changes to the battery, as weak batteries are the main cause of vehicle breakdown in more than 50% of cases according to a study by the ADAC, the German automobile association.

APPLICATION

The intelligent battery sensor (IBS) from HELLA is the key element of vehicle energy management.

The IBS reliably and accurately measures the battery voltage, current and temperature parameters. Information on the state of charge (SOC), state of health (SOH) and state of function (SOF) of the battery is calculated algorithmically using the measurements. The IBS is designed to be used in starter (standard or EFB), gel and AGM batteries to monitor in-vehicle starter or consumer batteries. The IBS can be directly integrated into the vehicle’s electrical system with the standardised LIN protocol.

53 % – Battery
19 % – Alternator
18 % – Other causes
10 % – Starters

### Design and Function

**IBS battery sensor**
1. Shunt on the sensor
2. Male connector
3. Sensor module
4. Negative pole terminal
5. Screw-on bolt for battery pole adapter

Fitted on standard battery terminal
(Battery pole adapter not included in scope of delivery).

The IBS is attached directly to the negative pole of the battery via the pole terminal. Alongside the terminal, the mechanical portion of the battery sensor consists of the shunt and grounding bolt. The shunt is attached to the vehicle’s load path and is used as a measuring resistor to measure the current indirectly. The ground cable can be conveniently attached to the grounding bolt, e.g. with the optionally deliverable battery pole adapter.

The electronics are located in a cast housing with a plug connector which functions as the interface to the energy management system. The LIN protocol is the communication interface to the higher-level control unit. The supply voltage, used simultaneously as the reference voltage for voltage measurement, is provided by the connection to the positive poles of both batteries.

### Energy Management with Intelligent Battery Sensor

By using the intelligent battery sensor, the energy management system can react quickly in case of critical battery state and influence both consumer behaviour and the alternator.

Mechanical Energy  ➔  Increasing of Idle Speed

Monitoring of Alternator  ➔  Influence on Consumer  ➔  Energy management

Electrical Energy  ➔  Battery

Battery parameters (voltage, current, temperature, SOC, SOH)  ➔  LIN Bus  ➔  Intelligent battery sensor
The ASIC is the main electronics component used to record and process measured values. Measured value acquisition in the ASIC, as a precision sensor, is the core function of the intelligent battery sensor and is used to record the physical parameters of current, voltage and temperature.

¹ Typical condition: $T_s \leq 80^\circ$C, $U_b = 24$ V

Approved for maximum 500 ms.

Other configurations on request.
## SUMMARY OF VERSIONS

A screw-on battery pole (battery pole adapter) can also be ordered as an optional accessory.
