

New on the market—brake calipers without core charge processing

The brake caliper portfolio from brake specialists Hella Pagid have been proven in use and established on the market for a long time. The product range is now being expanded by 112 new brake calipers for the independent aftermarket. The special feature: The new products are handled completely without core charge processing!

Core charge processing means challenges

It is especially small and medium-sized wholesalers and workshops who can speak about this firsthand: Products with core charge processing place additional demands on resources, particularly in the form of process costs, capital lock-up and storage capacities. The old parts need to be stored somewhere – thus using up a lot of space, which is oftentimes quite scarce in small enterprises.

With or without core charge: Workshops have the choice

It is also from this viewpoint that, to start with, Hella Pagid has now expanded its brake caliper product range by 112 new products without core charge processing, which cover a variety of popular vehicle makes. These products enhance the existing "Reman" portfolio, i.e. remanufactured brake calipers that do have core charge processing.

Going forward workshops will thus have the choice – and will be able to decide between coconscious refabricated brake calipers with core charge processing and new parts without core charge. When exchanged for new parts, the old brake calipers can be immediately disposed of, thus not requiring any storage capacities.

Accessories are already included

Each of the products of the new parts product range without core charge include a premium accessories kit alongside the actual item. Components such as grease, rubber parts and screws, as well as corresponding guide bolts, are all included. With a clear advantage—time-consuming cleaning efforts or expensive additional purchases are therefore unnecessary.

Christian Berlich, Product Manager at Hella Pagid, on that point: "Every time the brake calipers are replaced, we recommend that the guide bolts be replaced as well, so that the sliding mechanism of the floating caliper functions flawlessly and the brake pads wear evenly and without noise. Therefore, we supply workshops with the complete package outright."

High parts quality

Just like the Reman products, the new core charge-free brake calipers from von Hella Pagid go over well thanks to their premium parts quality, which is ensured by audited manufacturing processes and testing processes. These test processes include pressure tests, emergency brake function tests and a painstaking final inspection, among others. Only those products that have successfully passed all testing procedures are delivered to customers. All cast calipers produced at Hella Pagid receive a special surface treatment—a further positive for the quality of the parts.

Conclusion: An alternative that is worth your while

Thanks to the new core charge-free Hella Pagid brake calipers, workshops can now select a convenient alternative without needing to make trade-offs, maintaining the usual product quality they are used to. With its parts product range of new parts, featuring 112 brake calipers to start with, Hella Pagid is the first supplier on the market today to offer such an efficient solution!
