

# Citroën C1 - Motoren kan ikke starte | HELLA

**Citroën C1** Årgang: fra 2007 Motor: Benzin 1.0 I (CFA) Motoren kan ikke starte. Hvis der klages over, at motoren i disse modeller ikke kan starte, kan årsagen være en defekt sikring. Sikringen (org. res.nr.: 6500FJ) sidder på undersiden af sikringsboksen i motorrummet (denne sikring er ikke angivet i alle eldiagrammer). Hvis sikringen er brændt over, er bilen helt uden spænding hhv. kan der ikke løbe strøm fra batteriet til bilens ledningsnet. Det er også umuligt at udlæse fejlkoder. Afhjælpning sker ved at udskifte sikringen, kontrollere/oplade eller evt. udskifte batteriet samt slette evt. fejlkoder. Bemærk: Afhjælpningsforsøg som start med startkabler hhv. udskiftning af batteriet (uden kontrol) vil i dette tilfælde være virkningsløse.

**C1**

**Model year: 2007 onwards**

**Engine: Petrol 1.0I (CFA)**

**Engine cannot be started.**

If it is reported that the engine does not start for these vehicles, a defective fuse should be considered a potential cause.

The safety fuse (original part number: 6500FJ) is located on the underside of the fuse box in the engine bay (this fuse is not listed in all circuit diagrams).

If the fuse has blown, the vehicle is entirely without power or power is prevented from flowing from the battery to the on-board electrical systems. Even the error memory cannot be read out.

To correct this, the fuse has to be replaced, the battery has to be checked/charged or replaced if necessary and any error codes that are stored have to be cleared.

Please note:

Prior actions, such as attempts at remote starting or replacing the battery (without testing), cannot do anything to correct the issue.
