

## ***Opel Sintra from model year 1997 with 2.2 l engine***

### **Poor engine running, noises, vibrations, idling fluctuations and lack of performance**

If there are complaints with this vehicle that the engine does not run well, causes noises and vibrations, fluctuates when idling and lacks performance, one possible cause could be a faulty or incorrectly fitted gasket for the exhaust gas recirculation valve.

To eliminate the fault, check the air-tightness of the exhaust gas recirculation valve and replace the gasket if necessary.
